Digital Solutions: AUTOPILOT - autonomous driving services to boost efficiency

The EU's AUTOPILOT project is trialing services of this kind on the market, including self-driving vehicles in local public transportation, self-parking cars, and real-time car sharing. Such solutions are particularly efficient and environmentally friendly, resulting in an estimated 10 percent fewer CO2 emissions compared to conventional driving practices. The project launched in 2017 and will run until 2019. Thereafter the services will be incorporated into regular operations. T-Systems is the project partner of AUTOPILOT and supports analyses on the feasibility and market launch of the new services. The project has successfully been finalized in 2019, a follow-up project has already been won and the work has been started.
