Digital Solutions: Connected Car - preventing traffic jams with connected cars

T-Systems has been developing and operating Daimler's Connected Car platform (Daimler vehicle backend) worldwide since 2013. The platform is the technical basis for the Live Traffic service, which provides drivers with real-time traffic information, Live Traffic prevents about 30 percent of traffic jams per vehicle. This means the approximately 12 million vehicles equipped with Live Traffic consumed about 13 million liters less fuel. This translates into CO2 savings of around 32,500 metric tons.
