Digital health care system: Deutsche Telekom as a project partner

We are helping shape the digital health care system with numerous pilot projects.

- We are involved as a project partner in developing a solution for antibiotic treatment consultation at the St. Georg Hospital in Leipzig. The primary goal is to enable fast, secure data exchange between doctors, patients, and health insurers. The State of Saxony sponsored the project with over 1.2 million euros at the beginning of 2017. It will initially run until mid-2019.
- The main objective of the “Psychological Trauma Telehealth Network for Saxony (Tele-NePS)” project is to sustainably improve the integrated treatment chain for post-traumatic stress disorders. The goal is to enable those affected to access the treatment network, make expertise universally available, and guarantee cross-institution documentation and coordination. The EU and the State of Saxony will be funding the project, which will run until 2020, with 1.4 million euros.
- Under the auspices of a 10-year partnership, we are helping Kliniken Essen-Mitte (KEM) to drive forward the digitalization of its hospitals. By January 1, 2019, we had replaced the existing hospital information system with our iMedOne solution at two of the clinic’s locations.
